CARBON CREDIT COINS

CCC | Environmental Assets & Digital Infrastructure

OFFICIAL PROJECT WHITEPAPER 2026

Institutional presentation | Version 1.0 — documentation updateable

A framework connecting environmental asset documentation, transparent accounting and blockchain-enabled transfer infrastructure.

01 Executive Overview

Carbon Credit Coins (CCC) is a digital-asset initiative focused on creating an accountable interface between documented environmental projects and blockchain-based records. The initiative seeks to improve traceability, reporting, governance and access to environmental-asset information for qualified participants. The project documentation supplied by its sponsor describes an Atlantic Forest asset program in Brazil and a technical environmental assessment attributed to Neutralize Carbono Ltda.

02 Mission & Strategic Vision

CCC aims to connect environmental integrity with modern financial infrastructure through measurable impact, transparent documentation and controlled digital representation. The initiative prioritizes a clear distinction between ecological impact, verified credit issuance, token balances, custody and available market liquidity.

03 Underlying Environmental Project

The supplied project dossier identifies the Atlantic Forest biome in the State of São Paulo, Brazil, under internal project reference CCC-ATL-BR-SP-0001. It describes a project area of 100,000 hectares and an environmental volume of 15,000,000 tCO2e, with a proposed annual generation reference of 500,000 tCO2e. These are sponsor-documented figures; their treatment as issued and transferable carbon credits requires confirmation of the relevant registry records and serial-number status.

04 Independent Technical Assessment

The materials include a certificate image attributed to Neutralize Carbono Ltda. identifying a technical environmental audit of environmental data and carbon-credit valuation methodology. The certificate names a technical signatory and provides an internal certificate reference. The project sponsor reports that the independent audit has been completed. The final public documentation package should include the complete signed report, its scope, methodology, issuance date and an issuer-authenticated copy.

05 Certification & Registry Traceability

The supplied dossier references the Verified Carbon Standard (VCS) and Verra Registry project ID 4122. CCC intends to maintain project-to-unit traceability through registry identifiers, issuance status, serial ranges and retirement records. Registration, verification, issuance and retirement are separate milestones; a reference in a document is not itself proof of issuance. The public evidence annex will provide direct registry links and confirmed unit status when reconciled.

06 Asset Valuation & Financial Model

The dossier presents a reference price of USD 12.00 per tCO2e and a gross illustrative valuation of USD 180,000,000, calculated as 15,000,000 × USD 12.00. It also presents an illustrative 15% valuation haircut, yielding USD 153,000,000. These calculations are arithmetic scenarios based on supplied assumptions, not a guarantee of realizable value, credit availability, collateral eligibility, bank financing or redemption.

07 Token Architecture

CCC is described as an ERC-20-compatible token initiative. The supplied dossier contains a smart-contract reference and mentions Hyperledger Besu. Any claim of an operational bridge, reserve linkage or one-to-one token backing will be supported by a published technical architecture, verified contract deployment, token supply reconciliation and auditable reserve-allocation rules. Tokenization does not automatically convey ownership of land, a carbon credit or a banking instrument.

08 Governance & Controls

The proposed governance model includes documented authorization of asset allocation, separation of responsibilities, access controls, transaction monitoring, versioned reporting, and independent review. A formal policy will define minting, burning, transfers, reserve changes, conflicts of interest and emergency interventions. Private keys and sensitive custody credentials must never be published.

09 Custody & Institutional References

The supplied documentation includes statements attributed to Deutsche Bank concerning custody, risk treatment, guarantees and a liquidity facility. Those statements are included in the underlying dossier but have not been independently authenticated for this whitepaper. They are therefore not represented here as a confirmed bank commitment, available credit line, cash balance, approved collateral status or endorsement. Institution-authenticated confirmations may be incorporated in a future revision.

10 Liquidity & Market Access

CCC may pursue compliant secondary-market access and liquidity arrangements subject to legal review, counterparty onboarding, exchange or protocol requirements, treasury policies and actual funding. An environmental asset valuation is not the same as liquid reserves. No fixed price, yield, redemption right or immediate liquidity is promised by this document.

11 Verification & Disclosure Framework

The evidence package will distinguish (a) sponsor statements, (b) signed technical reports, (c) registry-issued records, (d) blockchain-verifiable data, and (e) direct institutional confirmations. Each material claim will be paired with an issuing body, reference, verification method and last-checked date. New evidence will be added through version-controlled appendices without retroactively altering prior disclosures.

12 Risks & Legal Considerations

Relevant risks include project performance, carbon accounting changes, registry rules, double counting, custody disputes, smart-contract vulnerabilities, market volatility, liquidity shortfalls, counterparty exposure and changes in law. This paper is informational and is not an offer of securities, a bank guarantee, a certification certificate or investment advice. Any offering requires jurisdiction-specific legal and regulatory assessment.

13 Evidence Annex — Update Register

Technical environmental audit: referenced in supplied certificate, issuer authentication to be attached. VCS / Verra project and units: referenced in supplied dossier, live registry reconciliation to be attached. Smart contract: address referenced in dossier, deployment and code verification to be attached. Institutional custody and financial facility: referenced in dossier, direct institution-issued confirmation to be attached. Environmental land and GIS data: referenced in dossier, authoritative land records and polygon validation to be attached.

14 Closing Statement

Carbon Credit Coins seeks to establish a disciplined connection between environmental stewardship, auditable asset records and responsible digital infrastructure. Long-term credibility will depend on evidence quality, transparent reporting, prudent governance and accurate communication of the rights and risks associated with each instrument.

Document status: institutional project whitepaper. Financial and certification references are attributed to supplied project materials and remain subject to issuer or registry authentication where indicated.
